Action Requested

Provide a dietary exposure analysis for the use of imidacloprid in/on pecans. The petition requests and CBTS recommends that a tolerance of 0.05 ppm be established on pecans. (See memo, F. Griffith, 6/6/95).

Discussion

Toxicological Endpoint:

The Reference Dose (RfD) used in the analysis is 0.057 mg/kg bwt/day, based on a NOEL of 100 ppm (5.70 mg/kg bwt/day) from a two year rat feeding study that demonstrated increased thyroid lesions in males at the next highest dose. An uncertainty factor of 100 was applied. The HED RfD Peer review Committee also classified imidacloprid as a Group E carcinogen (G. Ghali memo, 11/10/93).

An acute dietary assessment is required by the Toxicology Endpoint Selection Document for imidacloprid (M. Ottley & K. Baetcke memo, 4/18/94). The endpoint for acute dietary risk assessment is 24 mg/kg/day, the NOEL from the rabbit developmental study. The LEL (72 mg/kg/day) was based upon decreased body weight, increased resorptions, abortions, and increased skeletal abnormalities.

Residue Information

Tolerances for imidacloprid are published in 40 CFR §180.472. For the purposes of this analysis, the new tolerance for pome fruits was upgraded to pending status. There are no anticipated residues nor percent crop treated estimates. All uses assume 100 percent crop treated.

Even though finite residues will occur in meat, milk, poultry and eggs from the feeding of imidacloprid treated RACs or their processed feed items, adequate total imidacloprid secondary tolerances have been established (See memo, F. Griffith, 6/6/95).

Results

A summary of the residue information considered in this analysis is attached as Table 1. A DRES chronic exposure analysis was performed using tolerance level residues and 100 percent crop treated information to estimate the Theoretical Maximum Residue Contribution (TMRC) for the general population and 22 subgroups. Summaries of the TMRCs and their representations as percentages of the Reference Dose (RfD) are included as Tables 2 & 3. Summaries of the acute dietary risk for the subgroup females(13+ years) are attached as Table 4.

Chronic Exposure Analysis

Exposure from Published Uses of imidacloprid:

<u>Subgroup</u>	<u>Exposure (mg/kg/day)</u>	<u>%RfD</u>
U.S. Population	0.008187	14.4
Children (1-6 years old)	0.016934	29.7

Proposed new Tolerances on pecans:

U.S. Population	<0.000001	.000
Children (1-6 years old)	<0.000001	.001

If the new tolerances on pecans are approved:

U.S. Population	0.008187	14.4
Children (1-6 years old)	0.016934	29.7

The chronic analysis for imidacloprid is a worst case estimate of dietary exposure with all residues at tolerance level and 100 percent of the commodities assumed to be treated with imidacloprid. Even without refinements, the chronic dietary risk from exposure to imidacloprid appears to be minimal for this petition on pecans at 0.05 ppm.

Acute Exposure:

The endpoint for acute dietary risk assessment is the NOEL (24 mg/kg/day) from the rabbit developmental toxicity study. The LEL (72 mg/kg/day) was based upon decreased body weight, and increased resorptions, abortion and increased skeletal abnormalities. Because the effects of concern are developmental in nature, the only subgroup of concern is females (13+ years old).

Generally, acute dietary margins of exposure greater than 100 tend to indicate no dietary risk concern. The MOE value of 480 demonstrates no concern for females of child-bearing age considering the proposed tolerances.

There appears to be no acute dietary concern for the proposed tolerances on pecans.
